

# The World's Greatest TODO APP

Group MJ's

## Problem Statement

Management wants to be more organized with tasks to-do.

Current options do not provide higher organization of groups or roles

# Use Case - New Project

## 1 Preconditions

Manager has a developed project plan

## 2 Main Flow

Manager will create a new project [S1]. He will then define larger goals and some smaller tasks [S2]. Manager creates a task for the team to introduce and discuss the new project [S3].

## 3 Sub Flows

[S1] Manager will create a new list for the project/event on unique manager interface

[S2] Manager will create sub-goals in the project

[S3] Manager will create a task for a team meeting with the time and place and then push this to the list of all of the team members.

## 4 Alternative Flows

[E1] Manager can add more tasks for the future

# Use Case - Team member plans their day

## 1 Preconditions

Team member is integrated into the team and the app. There are tasks to claim and be completed or tasks already on the team members to do list.

## 2 Main Flow

Team member will check team wide task list, possibly claiming some [S1]. Team member will select tasks to complete that day [S2]. Team member will export to external calendar [S3].

## 3 Sub Flows

[S1] Team member will open tab with list of unclaimed tasks.

[S2] Team member selects tasks to complete and if they wish add what times they will work on each task.

[S3] Will be able to export to Google or Microsoft calendar to more easily see the plan for the day.

## 4 Alternative Flows

[E1] If there are no tasks, every team member can add more to their own list.

# Relation To Project Goals

To help improve the software engineering process

Give more organization and accountability options for project management
